# **Anal Fissure – Treatment: What are the goals?**

- Resolve the pain
- Heal the fissure
- Maintain continence
- Keep the fissure healed

## Manual Dilatation of the Anus

- Four fingers
- Significant incontinence and recurrence in some series
- Fragmentation of IAS seen on anal ultrasound

# Surgical Fissurectomie

## Delayed fecal incontinence following surgery for anal fissure

**Fig. 3** Time interval between anal sphincter damage and incontinence: fissure surgery and obstetric trauma

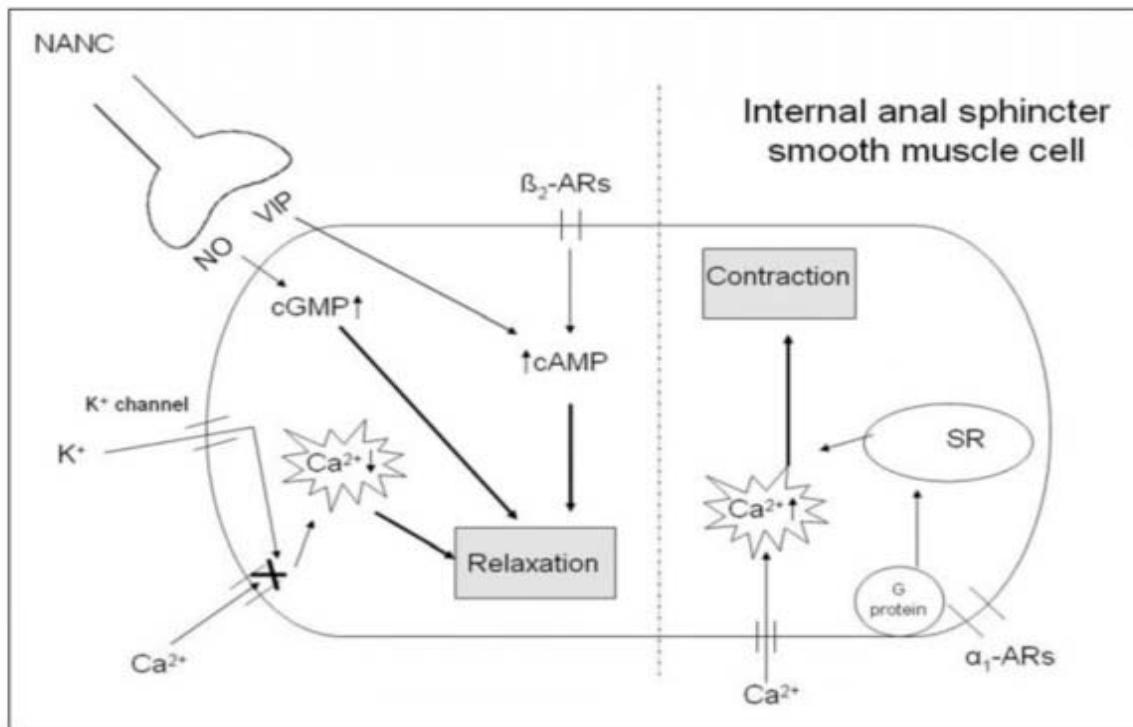

*Conclusions* Fecal incontinence may present as a late complication of anal fissure surgery. Incontinence may be associated with other cofactors accumulating over time or, more likely, anal fissure surgery may accelerate the physiologic age-related weakening of the anal sphincter mechanism. Candidates for anal fissure surgery should be informed regarding this possible outcome.

# Pathogenesis of Anal Fissure

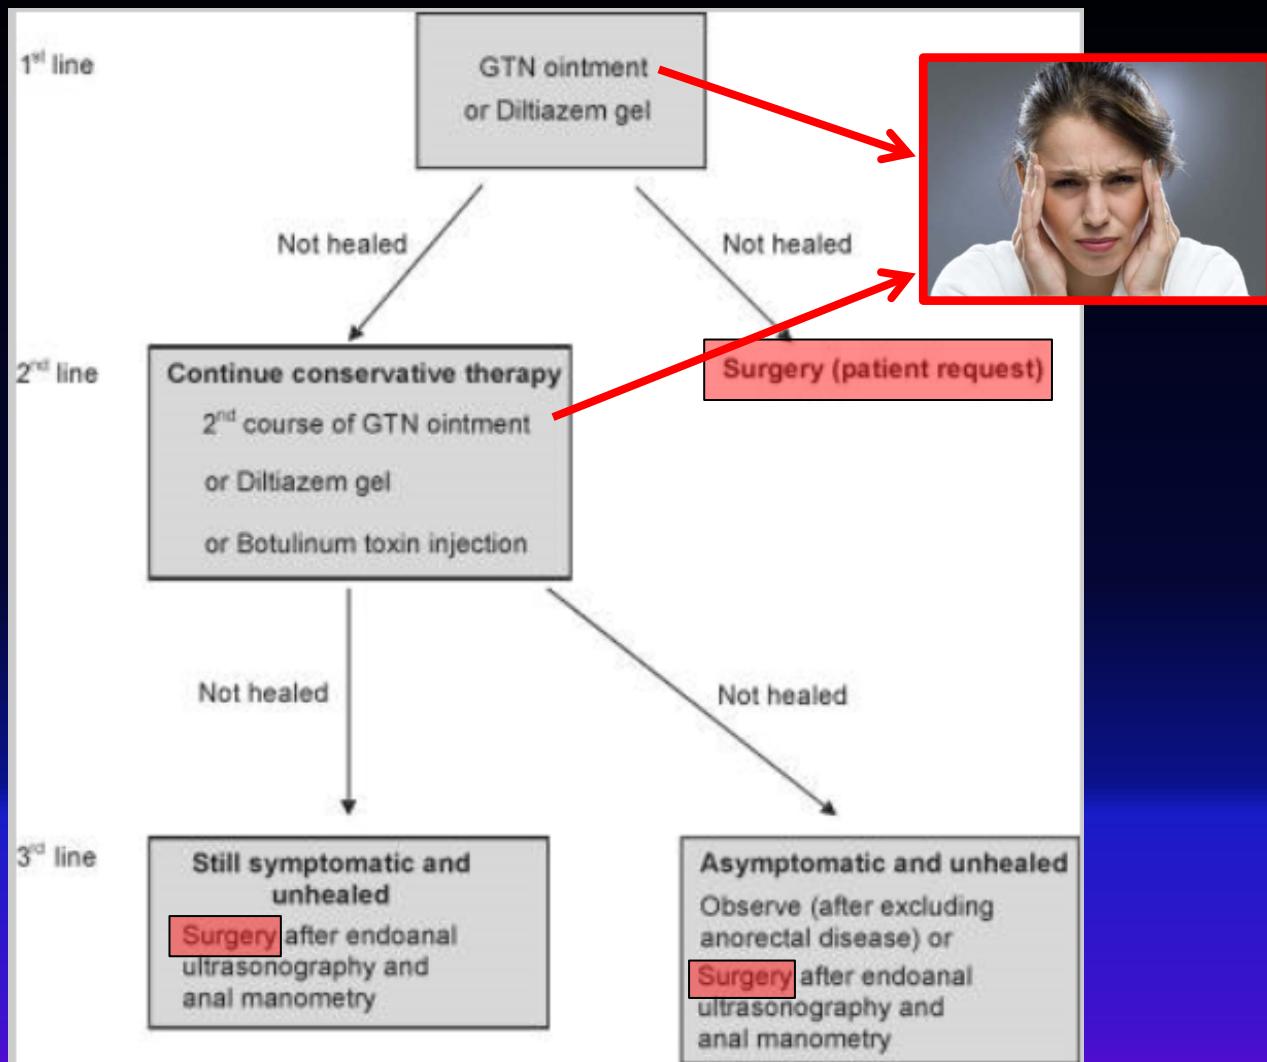

Does low-pressure chronic anal fissure have a different pathophysiology?  
Lindsey I. et al. Colorect Dis 2011;13:1014-8

# Pathophysiology of Fissure

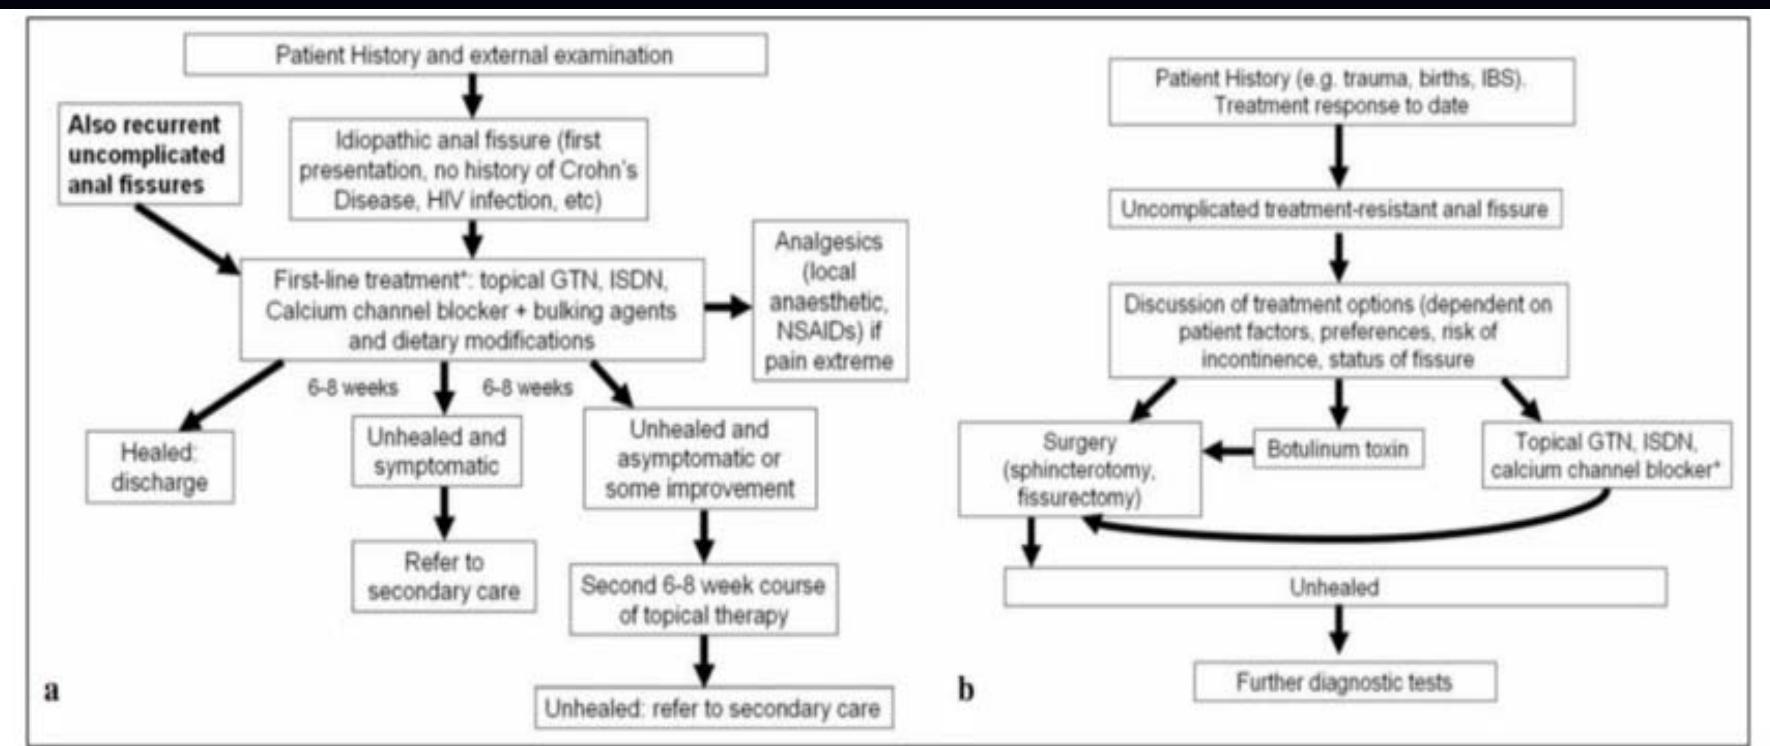

**Fig. 1** Control of internal sphincter smooth muscle cell. Contraction of the smooth muscle cell within the internal anal sphincter is dependent upon increased intracellular calcium. This is either by influx through calcium channels or via stimulation of  $\alpha_1$ -adrenoceptors. Relaxation of these cells is mediated through directly decreasing intracellular calcium concentration as well as increasing cGMP and cAMP. Influx of potassium through K<sup>+</sup> channels hyperpolarises the cell membrane and decreases calcium entry. Activation of  $\beta_2$ -adrenoceptors increases cAMP, returning intracellular Ca<sup>2+</sup> to the sarcoplasmic reticulum. VIP has a similar mode of action. Nitric oxide increases cGMP, which results in muscle relaxation. NANC, non-adrenergic, non-cholinergic;  $\alpha_2$ -ARs,  $\alpha_2$  adrenoceptors;  $\beta$ -ARs,  $\beta$  adrenoceptors; NO, nitric oxide; VIP, vasoactive intestinal polypeptide; cGMP, cyclic guanosine monophosphate; cAMP, cyclic adenosine monophosphate; SR, sarcoplasmic reticulum

# Usefulness of manometry to select patients with anal fissure for controlled anal dilatation

2010

C. Santander, J. P. Gisbert, R. Moreno-Otero, A. G. McNicholl and J. Maté

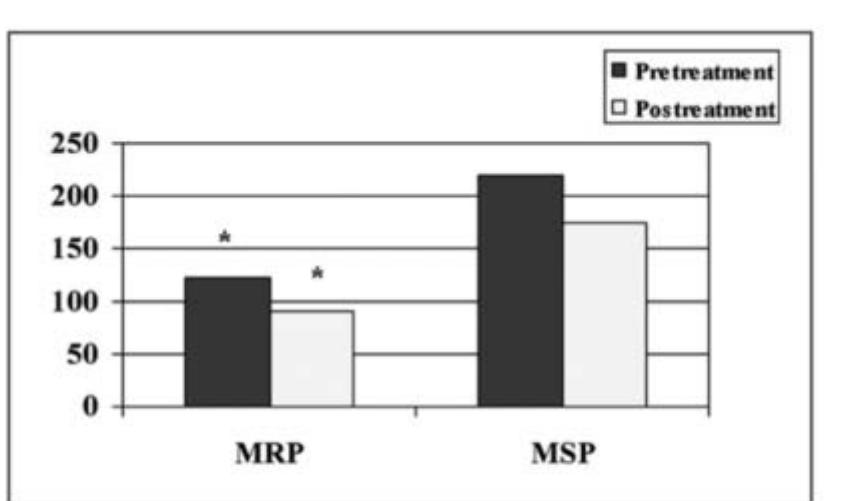

Fig. 2. Maximum resting pressure (MRP, mmHg) and maximum squeeze pressure (MSP, mmHg) pre-controlled anal dilation and 1 month post-controlled anal dilatation in patients with chronic anal fissure and internal anal sphincter spasm.

**Conclusions:** Anal healing of chronic anal fissure and a significant decrease in maximum resting pressure recorded by manometry confirms the success of this procedure. The manometric evaluation of the maximum resting pressure is useful in the selection of chronic anal fissure patients for controlled anal dilatation. The efficacy of dilatation to treat chronic anal fissure in patients with raised anal sphincter pressure was high and complications were rare.

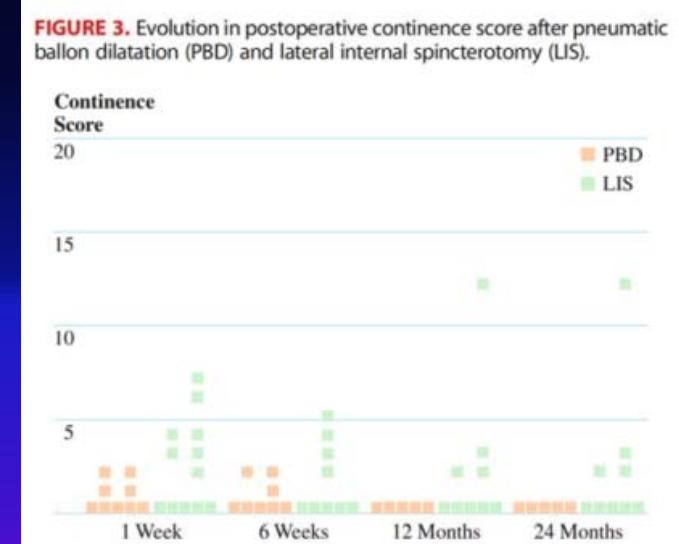

**FIGURE 1.** Preoperative and postoperative mean resting pressure in pneumatic balloon dilatation (PBD) and lateral internal sphincterotomy (LIS) groups.

**CONCLUSIONS:** As lateral internal sphincterotomy, pneumatic balloon dilatation grants a high anal fissure-healing rate but with a statistically significant reduction in postoperative anal incontinence.

**FIGURE 2.** Evolution in postoperative mean pain score after pneumatic balloon dilatation (PBD) and lateral internal sphincterotomy (LIS).

**FIGURE 3.** Evolution in postoperative continence score after pneumatic balloon dilatation (PBD) and lateral internal sphincterotomy (LIS).

## **Sphincterotomy in Women With Chronic Anal Fissure? Are We Asking for Trouble?**

*Ribas, Dis Colon Rectum 2014*

# **Anal Fissure – Conclusions**

- Anal fissure? Other causes?

- Diagnostic tools: Finger...

- Smear, Manometry, EUS, Bx

- Therapeutic non-surgical possibilities:

- local Ca-Antagonist, Nitroglycerin, Botulinum Toxin

- more invasive, but fast resolution of pain: Balloon-Dilatation

**Team-work!**
